

Two plugins that put **ElevenLabs AI voices inside your DAW**. No Python, no scripts, no terminal - install, open, create.

Designed and produced by **Saurabh Mehta** · Studio10A · Indore · Mumbai · Delhi · studio10a.com

VOICELAB

VOICE TO VOICE

Changes the voice of anything already recorded on your timeline. Select an item, pick a voice, press Convert - the item plays back in the new voice, with the original untouched one click away. Works in any DAW with ARA2:

REAPER, Studio One, Cubase, Nuendo, Cakewalk, Samplitude.

TEXTLAB

TEXT TO SPEECH

Type a script, pick a voice, Generate - then **drag the audio straight onto your timeline**. Works in every DAW that loads VST3 plugins, no ARA needed.

Install - Windows (2 minutes)

- 1 **Close your DAW.**
- 2 **Double-click "Studio10A-Voice-Suite-Setup.exe"**
 . If Windows shows a blue "protected your PC" screen, click **More info** → **Run anyway** (the installer is unsigned, that is all). Click Next until it finishes.
- 3 **Open REAPER → Options → Preferences → Plug-ins → VST → "Re-scan"**
 . Both plugins appear as *Studio10A VoiceLab* and *Studio10A TextLab*.

Install - Mac (2 minutes)

- 1 **Close your DAW.**
- 2 **Right-click "Studio10A-Voice-Suite-Mac.pkg" → Open → Open.**
 (Right-click, not double-click - it skips the unsigned-installer warning.) Follow the installer.
- 3 **Re-scan plugins in your DAW**
 (REAPER: Preferences → Plug-ins → VST → Re-scan).

First open - the API key

Open either plugin. If the top of the window shows the Settings panel, paste your **ElevenLabs API key** (from elevenlabs.io → profile icon → API Keys) and click **Save key & test**. Then click **Sync voices from ElevenLabs** once.

On Saurabh's own Mac none of this is needed - the key and the full 870-voice library with all folders and favorites were imported automatically from the REAPER VoiceLab.

The key is stored only on your computer, never inside project files, so projects are safe to share.

VOICELAB

STEP BY STEP

- 1 **Select the audio item**
you want to re-voice (a VO line, a scratch vocal, anything with speech).
- 2 **Press Shift+E**
(Take FX) and add "**VST3: Studio10A VoiceLab (ARA)**". The plugin opens showing your item's waveform. *If it says "needs to run as an ARA plugin", right-click the plugin in the FX browser and enable "Allow ARA".*
- 3 **Pick a voice on the left.**
Search by name, filter by folder (Ad Voices, Hindi / Indian, Trailer / Story...), star ★ your favorites, and press ► to audition any voice free of charge.
- 4 **Press CONVERT.**
A progress bar runs while ElevenLabs works. The item now plays in the new voice. **Select several clips at once** (each with VoiceLab on it) and the button becomes CONVERT N CLIPS - one press converts them all with the chosen voice, one after another.
- 5 **A/B with the VERSIONS chips**
above the Delivery panel: **ORIGINAL, AI [Voice] G001, G002...** every conversion is kept. Click any chip to hear it instantly; right-click a chip to delete that version. The plugin follows the item it sits on automatically - there is nothing to select. A "Source: always the original" checkbox controls whether conversions start from the clip's recording (default) or chain from the active version - voice on voice. Drag any VERSION chip onto another track to export that take. Whatever chip is active is what renders when you bounce.

Where everything is saved

- All takes live **inside your project** (the ARA archive) - close and reopen, they are all still there.
- Every conversion is also written as a WAV named after the voice - **Aakash Aryan G002.wav** - to **Documents/Studio10A Voice Suite/VoiceLab/**, so you can grab it for another project.

The delivery controls

Stability	Lower = more expressive and lively, higher = calmer and more consistent. Start at 0.50.
Similarity	How hard it sticks to the target voice's character. Start at 0.75.
Style	Exaggerates the voice's natural delivery style. 0 = neutral.
Speaker boost	Keeps the output closer to the target speaker. Usually on.
Remove noise	Cleans background noise from your source before converting.
Seed	Same seed + same settings = repeatable result. Leave blank for natural variation.
Presets	Clean Ad VO, Movie Trailer, Natural Dialogue, Comic Punch, Brand Tagline, Emotional Soft - plus save your own with "Save preset".

Model tip: **Multilingual STS v2** handles Hindi and Hinglish; **English STS v2** is a touch faster for pure English. Conversions cost roughly **\$0.12 per minute** of audio - the plugin shows the estimate next to Convert and asks before anything expensive.

TEXTLAB STEP BY STEP

- 1 Two ways to use it.**
On a **clip** (Studio One Event FX, REAPER take FX): it docks like VoiceLab and the clip itself becomes the speech, with VERSIONS chips - generate again, compare, drag any chip to another track. Or on a **track** as a normal insert: the floating window with drag-and-place.
- 2 Type or paste your script**
, or click **Load .txt**. The counter under the script shows characters and the credit cost before you spend anything.
- 3 Pick voice, model and delivery.**
With the **Eleven v3** model, click the emotion chips - `[excited]` `[whispers]` `[sighs]` `[laughs]...` - to drop performance notes right into the text at the cursor. Add your own tags with `+`.
- 4 Pick 1-3 takes and press GENERATE.**
Multiple takes = multiple renditions of the same line with different seeds - audition, keep the best. "Clip per line" makes one clip per line (dialogues); off = one flowing performance (v3 monologues).
- 5 Use the GENERATIONS tab**
: click a clip - its script shows beside it (Load into script / Copy / Show file). ▶ plays through the track. In REAPER, **PLACE ON TIMELINE** or **Auto-place** drops clips at the cursor. Elsewhere, grab the gold **DRAG** handle or drag any row. Double-click a row to reload its settings.

TextLab extras

- **Speed** slider (0.7-1.2) and a **language code** box (`hi` , `en` , `mr` ...) to force a language on Turbo/Flash models.
- Files: `TTS - Aakash Aryan - v3 - 01.wav` in `Documents/Studio10A Voice Suite/TextLab/` , never overwritten. SETTINGS tab: cache/list clearing, **Light skin**, and the shortcut list (**Cmd/Ctrl+Return** = Generate/Convert, **Cmd/Ctrl+0-9** = switch versions).
- Hindi and Devanagari text work natively in the script box.

IF SOMETHING LOOKS WRONG

Voice preview is silent	Previews play through the plugin's track - press play in the DAW once (REAPER usually doesn't need this), and check the track isn't muted.
"Needs to run as an ARA plugin"	VoiceLab must be a take FX on the item (Shift+E in REAPER), not a track FX. Enable "Allow ARA" for it in the FX browser if needed.
"Rejected the API key (401)"	The key is wrong or was revoked - paste it again in Settings and "Save key & test".
Output came back as MP3	Your ElevenLabs plan doesn't include WAV output; the plugin automatically fell back to high-quality MP3. Upgrade the plan or ignore - it still sounds great.
Credits badge red	The ElevenLabs account is out of credits. It resets on the date shown, or top up on elevenlabs.io .
Conversion failed mid-way	The exact error from ElevenLabs is shown in the status bar at the bottom - read it, it tells you what happened.

Both plugins share one voice library, one API key, one history and one settings file - set anything once and the other plugin knows it too.
