

Three plugins that put **ElevenLabs AI voices inside your DAW**. No exports, no browser tabs, no copy-paste - install, open, create.

Designed and produced by **Saurabh Mehta** · Studio10A Productions · Indore · Mumbai · Delhi · studio10a.com

VOICELAB · voice to voice, on the clip

Select a clip, pick a voice, Convert - the clip plays in the new voice, the original one click away, every take kept as a VERSION. ARA2 hosts: **Studio One, Nuendo, REAPER, Cakewalk.**

VOICELAB TRACK · any track, any DAW

A normal insert. Drop audio in, or arm **TRANSFER** and play - it records what flows through the track. Trim, Convert, drag the take back. **Logic Pro, GarageBand, Ableton Live, FL Studio** and every other VST3/AU host.

TEXTLAB · text to speech

Type or paste a script - Hindi, Tamil, Bangla, English, 70+ languages - pick a voice, Generate, drag the audio onto your timeline. On a clip it becomes the speech itself.

Install

Two ways, both free, both two minutes: the **installer** (Mac .pkg / Windows Setup .exe) or the **manual zip** (copy the plugin files yourself - nothing runs). Both are on the download page. Step-by-step, including every warning you may see, is on the next page.

First open - the API key

Open any of the three plugins. If the top of the window shows the Settings panel, paste your **ElevenLabs API key** (from elevenlabs.io → profile icon → API Keys) and click **Save key & test**. Then click **Sync voices from ElevenLabs** once. The gear in the top-right corner opens Settings again any time; **About** and **Help** (this guide) live there too.

The key is stored only on your computer, never inside project files, so projects are safe to share. All three plugins share one voice library, one key, one history and one settings file - set anything once and the others know it.

The free ElevenLabs tier is enough to try everything. Real work spends credits on your plan - each plugin shows the estimated cost before you press Convert or Generate, and the credit meter in the header shows what is left. **Mind the plan:** ElevenLabs' free plan does not include a commercial licence and requires attribution when you publish - client work (ads, radio spots, paid videos) needs a paid ElevenLabs plan. Check your plan's terms before delivering.

In this guide

Page 2 - Install	Installer or manual zip, Mac and Windows, every warning explained.
Page 3 - VoiceLab	Voice to voice on the clip (ARA2): convert, versions, batch, delivery controls.
Page 4 - VoiceLab Track	Any track, any DAW: drop in or TRANSFER, trim, convert, HOST SYNC, FOLLOW.
Page 5 - TextLab	Script to speech, v3 tags, ENHANCE on your own free AI key, takes, drag to timeline.
Page 6 - Help	If something looks wrong: the fix for each message, uninstall, good to know.
Page 7 - What's new	Update log, newest first.

Three things to keep in mind: the voices come from **your own ElevenLabs account** (your key, your credits, your plan's terms); the suite is **free for everyone**, shared as-is; and **Help** and **About** live behind the gear inside every plugin.

INSTALL **INSTALLER OR MANUAL - YOUR CHOICE**

The plugins are not code-signed (that costs money every year; the suite stays free instead), so your computer warns you once - here is exactly what it says and what to click. **Quit your DAW first.**

Mac - the installer (.pkg)

- 1 Right-click "Studio10A-Voice-Suite-Mac.pkg" → Open → Open.**
A plain double-click shows "cannot be opened because Apple cannot check it for malicious software" - that is the unsigned-installer notice; right-click → Open skips it. If it still refuses: System Settings → Privacy & Security → scroll down → **Open Anyway**.
- 2 Follow the installer**
(it asks for your Mac password - that is macOS, not us). It installs **VST3 and Audio Unit** versions of all three plugins for every user of the Mac, plus the help guide, licence and an uninstaller in `/Library/Application Support/Studio10A Voice Suite/`.
- 3 Start the DAW and rescan.**
Logic Pro / GarageBand pick the Audio Units up on their next start (if not: Logic → Settings → Plug-in Manager → Reset & Rescan Selection).

Mac - manual (the zip)

- 1 Unzip "Studio10A-Voice-Suite-Mac-manual.zip".**
Inside: `VST3/`, `Components/`, the licence, a README and **Install manually.command**.
- 2 Easiest: right-click "Install manually.command" → Open → Open.**
It copies the six bundles into `~/Library/Audio/Plug-Ins/VST3` and `.../Components` and clears the download quarantine flag, so the DAW loads them with no warning. **By hand:** copy the .vst3 bundles into the VST3 folder and the .component bundles into the Components folder above (Finder → Go → Go to Folder).
- 3 If the DAW says a plugin "cannot be opened because the developer cannot be verified"**
(only after a by-hand copy): System Settings → Privacy & Security → **Open Anyway**, then load it again - or in Terminal: `xattr -dr com.apple.quarantine ~/Library/Audio/Plug-Ins/VST3/Studio10A*.vst3`
`~/Library/Audio/Plug-Ins/Components/Studio10A*.component`. Then rescan as above.

Windows - the installer (Setup .exe)

- 1 Unzip "Studio10A-Voice-Suite-Windows.zip" and double-click "Studio10A-Voice-Suite-Setup.exe".**
Windows shows a blue "Windows protected your PC" screen: click **More info** → **Run anyway**. That is SmartScreen noting an unsigned installer, nothing more. Accept the licence, click Next until it finishes (it also copies the licence and notices next to the plugins).
- 2 Start the DAW and rescan**
(REAPER: Options → Preferences → Plug-ins → VST → Re-scan; Studio One: Options → Locations → VST Plug-ins; Cubase: Studio → VST Plug-in Manager).

Windows - manual (the zip)

- 1 Unzip "Studio10A-Voice-Suite-Windows-VST3.zip", copy the three .vst3 folders into `C:\Program Files\Common Files\VST3\`, rescan.**
Windows may ask for administrator permission to copy - that is the only prompt; nothing is executed, so SmartScreen never appears. The plugins appear as *Studio10A VoiceLab*, *Studio10A VoiceLab Track* and *Studio10A TextLab*.

Which should I pick? The installer is the smoother road (one warning, then silence). The manual zip is for people who prefer to see every file that lands on their machine - same plugins, same result. Uninstalling is on the Help page.

VOICELAB

ON THE CLIP · ARA2

- 1 **Select the audio clip you want to re-voice**
(a VO line, a scratch vocal, anything with speech).
- 2 **Add VoiceLab to that clip as an ARA plugin.**
REAPER: press **Shift+E** (Take FX) and add *VST3: Studio10A VoiceLab (ARA)* - if it asks, enable "Allow ARA" for it in the FX browser. Studio One: select the event, open the Inspector and add it under **Event FX**. Nuendo: **Audio** → **Extensions**. The plugin opens showing your clip's waveform.
- 3 **Pick a voice on the left.**
Search by name, filter by folder, star ★ your favourites, press ► to audition any voice free of charge.
- 4 **Press CONVERT.**
A progress bar runs while ElevenLabs works; the clip now plays in the new voice. **Select several clips** (each with VoiceLab on it) and the button becomes **CONVERT N CLIPS** - one press converts them all, one after another. Clips you split from one recording each get their own take.
- 5 **A/B with the VERSIONS chips**
above the Delivery panel: **ORIGINAL, AI [Voice] G001, G002...** every conversion is kept, per clip. Click a chip to hear it instantly (or Ctrl/Cmd+1-0 - the shortcut is printed on the chip); right-click a chip to delete that version. "Source: always the original" decides whether conversions start from the recording (default) or chain from the active version - voice on voice. Drag any chip onto another track to export that take. Whatever chip is active is what renders when you bounce.

Where everything is saved

- All takes live **inside your project** (the ARA archive) - close and reopen, they are all still there.
- Every conversion is also written as a WAV named after the voice - `Aakash Aryan G002.wav` - to `Documents/Studio10A Voice Suite/VoiceLab/`, so you can grab it for another project.

The delivery controls (same in all three plugins)

Stability	Lower = more expressive and lively, higher = calmer and more consistent. Start at 0.50.
Similarity	How hard it sticks to the target voice's character. Start at 0.75.
Style	Exaggerates the voice's natural delivery style. 0 = neutral.
Speaker boost	Keeps the output closer to the target speaker. Usually on.
Remove background noise	Cleans your source before converting (voice to voice).
Seed	Same seed + same settings = repeatable result. Leave blank for natural variation.
Presets	Clean Ad VO, Movie Trailer, Natural Dialogue, Comic Punch, Brand Tagline, Emotional Soft - plus your own with "Save preset".

Model tip: **Multilingual STS v2** handles Hindi and Hinglish; **English STS v2** is a touch faster for pure English. Conversions cost roughly **\$0.12 per minute** of audio - the estimate sits next to Convert and the plugin asks before anything expensive.

Logic Pro / GarageBand: Apple's native Logic does not hand ARA to third-party plugins, so VoiceLab shows a notice there. Use **VoiceLab Track** instead - same voices, same quality, on any track (next page).

VOICELAB TRACK

ANY TRACK · ANY DAW

1 Insert it on a track like any plugin

- Logic, GarageBand, Studio One, Cubase, Ableton, FL Studio, REAPER. No ARA, no ritual. Audio passes straight through; the plugin only listens when you ask it to.

2 Get audio into the SOURCE panel - three ways.

Add audio... or drop a file from Finder / Explorer / your DAW's file browser. **TRANSFER:** arm it, press Play in the DAW, stop when the line is done - the plugin records what flowed through the track as `Transfer - 01.wav` and remembers where on the timeline it came from. In REAPER, **GRAB SELECTED ITEM** pulls the selected item straight in. Up to 24 sources sit as chips.

3 Trim on the waveform.

Drag the gold edges, drag a fresh range, double-click for the whole file. ▶ previews the trimmed span with a cursor running through it; only the trimmed seconds are sent, so only they cost credits.

4 Pick a voice and press CONVERT.

Only the highlighted chips convert - click one, **Shift+click** to add more, and the button reads **CONVERT N SOURCES** with the estimate beside it. Each result is named `Voice - source - 01.wav`.

5 GENERATIONS - get it back onto your timeline.

▶ plays a take; grab the gold **DRAG** handle (or drag any row) and drop it on a track; double-click a row to reload its voice and settings. In REAPER, ▶ **HOST** rolls the transport.

6 HOST SYNC - hear the take in place.

Switch it on, select a TRANSFER-born take and press Play in the DAW: the take plays locked to the timeline at the spot it came from, replacing the original just across its span - your original track is never touched. Select other takes while looping to A/B them. Off = previews play on their own through the plugin.

7 FOLLOW - the plugin mirrors your cursor.

On by default: when the DAW cursor lands inside a take that knows its position (TRANSFER or REAPER grab), that source comes up by itself - waveform, cursor line, and its newest take below - so what you see is always what the DAW is on. With HOST SYNC on, the pinned take re-targets clip by clip. Shift-built batches are left alone; switch FOLLOW off to pin things by hand.

Where everything is saved

- Conversions and TRANSFER takes: `Documents/Studio10A Voice Suite/VoiceLab Track/`, never overwritten.
- The source list, trims and HOST SYNC state are saved with your project; the audio stays on disk where it already lives.

Dragging a region **from the arrange view** into the plugin does not work in any DAW - DAWs keep those drags private. Use TRANSFER (simplest), the REAPER grab, or drag the region to the Desktop first and then into the plugin.

Best habit for a VO session: put VoiceLab Track on the VO track, arm TRANSFER, play each line, Convert, HOST SYNC to audition, DRAG the keepers onto a new track. The whole pass happens without leaving the DAW.

TEXTLAB TEXT TO SPEECH

1 Two ways to use it.

On a **clip** (Studio One Event FX, REAPER take FX): it docks like VoiceLab and the clip itself becomes the speech, with VERSIONS chips - generate again, compare, drag any chip to another track. Or on a **track** as a normal insert (any DAW, Logic and GarageBand included): the window with drag-and-place.

2 Type or paste your script.

Or click **Load .txt**. Hindi, Devanagari and other scripts type natively. The counter under the script shows characters and the credit cost before you spend anything.

3 Pick voice, model and delivery.

With the **Eleven v3** model, click the emotion chips - [excited] [whispers] [sighs] [laughs]... - to drop performance notes into the text at the cursor; add your own with +.

4 ENHANCE (v3) - let the director place the tags.

Press **ENHANCE** at the right end of the tag row: your script goes to an AI model (on your own free key - see below), which weaves the right tags in while keeping every word exactly as written - the same idea as the Enhance button on the ElevenLabs site. **UNDO** puts your original back. Generate as usual afterwards.

5 Pick 1-3 takes and press GENERATE.

Multiple takes = renditions of the same line with different seeds - audition, keep the best. "Clip per line" makes one clip per line (dialogues); off = one flowing performance (v3 monologues).

6 Use the GENERATIONS tab.

Click a clip - its script shows beside it (Load into script / Copy / Show file). ► plays it. In REAPER, **PLACE ON TIMELINE** or **Auto-place** drops clips at the cursor. Elsewhere, grab the gold **DRAG** handle or drag any row. Double-click a row to reload its settings.

ENHANCE runs on your own free AI key

ENHANCE talks to an AI model through **your own key** - and **Google Gemini** and **Groq** give one away free, no card. First press of ENHANCE: pick a provider, press **Get free key** (it opens the right page - Gemini: aistudio.google.com → Create API key; Groq: console.groq.com/keys), paste the key, **Save & Enhance**. Done for good. Change it any time under **Settings** → **Enhance AI**, where Anthropic Claude, OpenRouter, a local Ollama or any OpenAI-compatible endpoint also work, with **Save & test** to prove the key. **Save two keys** (Gemini and Groq, both free): when one is busy or rate-limited, Enhance switches to the other by itself and tells you which one answered. Whatever the model, the plugin checks the answer: tags may be added, your words may not change. Keys stay on your computer, like the ElevenLabs key.

TextLab extras

- **Speed** slider (0.7-1.2) and a **language code** box (hi , en , mr ...) to force a language on Turbo/Flash models.
- Files: TTS - Aakash Aryan - v3 - 01.wav in Documents/Studio10A Voice Suite/TextLab/ , never overwritten.
- SETTINGS tab: output folder, cache/list clearing, **Light skin**, the shortcut list (**Cmd/Ctrl+Return** = Generate/Convert, **Cmd/Ctrl+1-0** = switch versions - editable), About and Help (this guide).

IF SOMETHING LOOKS WRONG

Windows: "it's a .zip"	Right-click → Extract All, then run <code>Studio10A-Voice-Suite-Setup.exe</code> from inside. Stores refuse bare installers, so the zip is the normal download.
Mac: "can't be opened"	Right-click the .pkg → Open → Open (or Privacy & Security → Open Anyway). Unsigned installer, nothing more. Manual copy blocked by "developer cannot be verified"? Privacy & Security → Open Anyway, or run the zip's "Install manually.command". Page 2 has the full steps.
Plugins missing in the DAW	Re-scan (REAPER: Preferences → Plug-ins → VST). Logic/GarageBand: restart the app, or Plug-in Manager → Reset & Rescan. The Audio Units are listed under the maker "Studio10A".
"Needs to run as an ARA plugin"	VoiceLab must sit on the clip - REAPER take FX (Shift+E, "Allow ARA" on), Studio One Event FX, Nuendo Extensions - not as a track insert. In Logic Pro and GarageBand there is no ARA for it at all: use VoiceLab Track .
Voice preview is silent	Previews play through the plugin's track while the DAW runs; when the DAW is stopped they play through your computer's default output. Check the track isn't muted.
"Rejected the API key (401)"	The ElevenLabs key is wrong or was revoked - paste it again in Settings and "Save key & test".
ENHANCE: "rejected the key"	That is your Enhance AI key (Settings → Enhance AI), not the ElevenLabs one. Get free key opens the provider's page - paste a fresh key and Save & test. "Rate limit reached" / "high demand" is the free tier's cap: with a second key saved Enhance switches over by itself; otherwise wait a moment and press again.
Output came back as MP3	Your ElevenLabs plan doesn't include WAV output; the plugin fell back to high-quality MP3. Upgrade the plan or ignore - it still sounds great.
Credits badge red	The ElevenLabs account is out of credits. It resets on the date shown, or top up on elevenlabs.io.
HOST SYNC does nothing	It needs a take that knows its timeline position - one converted from a TRANSFER (or a REAPER grab). Takes from dropped files have no position: DRAG those onto the timeline instead.
TRANSFER captured nothing	Arm it, then press Play in the DAW so audio actually flows through that insert. Anything under a quarter second is discarded as a blip; a take ends when you stop the transport or click TRANSFER again.
Conversion failed mid-way	The exact error from ElevenLabs is shown in the status bar at the bottom - read it, it tells you what happened.

Good to know

- Projects saved by 1.5.4 and later keep one active version per clip, even for clips split from the same recording. Older projects open fine; plugin builds before 1.5.4 cannot read those saves.
- The Studio10A title card shows once per plugin instance. Click the plugin name in the header for About and the version number.
- Uninstall: Mac - run `Uninstall Studio10A Voice Suite.command` in `/Library/Application Support/Studio10A Voice Suite/` (the help guide lives there too); Windows - Apps & Features. Your settings, voice library and history sit in your user Application Support (Mac) / AppData (Windows) folder named *Studio10A Voice Suite*; your audio in `Documents/Studio10A Voice Suite/`. Neither is touched unless you say so.

Free for everyone. If the Voice Suite earns its place in your sessions, buy us a coffee at payhip.com/b/rBIPg - and tell another producer. Sounds better.

UPDATE LOG

The suite grows with the sessions it is used in. Newest first; the full notes live on github.com/Acousticsaurabh/studio10a-voice-suite/releases.

1.6.0 · Aug 2026	VoiceLab Track, rebuilt around take lanes - the clips you captured lie along a timeline, every alternative take sits in a lane under its own clip, colour-coded per voice, and one click says which take that clip plays. Each clip keeps its own choice, HOST SYNC plays all of them where they belong, and the choice is saved with the project. A TRANSFER pass now splits into separate clips wherever you jump the DAW cursor, instead of running them together. Drag any take, clip or selection straight onto the timeline; Shift gathers several. The lane timeline scrolls and zooms from the ends of its own scrollbar, with optional playhead and auto-scroll. The voices list and the bottom panel fold away when you want the room. The Studio10A logo now sits in every plugin header.
1.5.6 · Aug 2026	Manual-install zips for Mac and Windows next to the installers (plain plugin bundles, nothing runs), with a helper that clears the Mac quarantine flag; this Install page. Licence and third-party notices shipped with every download; plain-language trademark notice in About. Title card once per DAW session. Generations list: right-click to remove entries whose file is gone. "Help" replaces "Manual" everywhere.
1.5.5 · Aug 2026	Enhance for free, on your own key - Google Gemini / Groq (free keys), Claude, OpenRouter, Ollama or any OpenAI-compatible endpoint; "Get free key" opens the right page; models are discovered live, never hard-coded; if one provider is busy, Enhance switches to the next key you saved. Word guard: tags may be added, words may not change. TextLab tag chips: your own tags in green, right-click to rename / remove / hide, rows wrap. One settings control: the gear toggles Settings.
1.5.4 · Aug 2026	FOLLOW in VoiceLab Track - the source under the DAW cursor comes up by itself, HOST SYNC re-targets clip by clip; REAPER grabs are timeline-stamped. Split-clip fix for VoiceLab / TextLab ARA - clips cut from one recording each keep their own active version (archive v3). Preview fix for shared-document hosts. CONVERT after a TRANSFER converts the fresh take. Windows installer also ships as a zip.
1.5.3 · Aug 2026	HOST SYNC - a converted take plays locked to the DAW timeline in place of the original. Convert only the selected sources (Shift-click to pick several). REAPER "► HOST" transport button.
1.5.2 · Aug 2026	TRANSFER - VoiceLab Track records what plays through the track, timeline-stamped. About card via the plugin title.
1.5.1 · Aug 2026	Previews play everywhere (Logic / GarageBand park idle inserts - previews now fall back to the system output). Studio10A title card once per plugin instance. About button.
1.5.0 · Aug 2026	VoiceLab Track - the third plugin: voice to voice on any track in any DAW, drag in / drag out, REAPER grab.
1.4.2 · Aug 2026	Audio Unit builds for Logic Pro and GarageBand alongside VST3, same installer.
1.4.1 · Aug 2026	Free release on Payhip (pay what you feel). Studio10A title card.
1.3.x · Aug 2026	VoiceLab (ARA2 clip conversion, versions, batch) and TextLab (script to speech, v3 tags, takes, drag to timeline) - the first public suite.

Ideas and bug reports: studio10a.com - every session teaches the next version. Sounds better.

Studio10A Voice Suite is not affiliated with, endorsed by, or sponsored by ElevenLabs. ElevenLabs is a trademark of ElevenLabs Inc., named here only to describe compatibility. The suite uses your own ElevenLabs account and API key; all usage is billed to you by ElevenLabs under their terms of service. ENHANCE uses an AI text provider of your choice under that provider's terms. Provided free and as-is, without warranty of any kind - see LICENSE.txt and THIRD-PARTY-NOTICES.txt, installed with the plugins. Studio One, Cubase, Nuendo, REAPER, Logic Pro, GarageBand, Ableton Live, FL Studio, VST and Audio Units are trademarks of their respective owners.
